

Microsoft Secure-Edge

A safe browsing experience

Microsoft Secure Edge is a suite of security features that are built into Microsoft's Edge web browser. These features are designed to help and protect users from online threats such as phishing attacks, malicious websites, identity theft, and other forms of cybercrime.

Helps users verify the authenticity of websites by displaying a green padlock icon in the address bar.

The padlock icon indicates that the website is using a secure connection and that the user's data is encrypted as it is transmitted between the user's device and the website.

- Offers a secure and private browsing experience
- Protects against several online threats
- Verifies authenticity of websites
- Allows private browsing

Main features:

SmartScreen Filter analyzes the content of websites and blocks access to potentially dangerous sites

Password Monitor helps users protect their online accounts by alerting them if their login credentials have been compromised in a data breach

InPrivate Browsing allows users to browse the web without leaving any trace of their activity on their device

Tracking Prevention blocks third-party tracking cookies and other technologies that are used to track users' online activity
